

You've been told to drink 8 glasses of water a day...

But could the invisible substances inside your water be poisoning you and your family?

The World Health Organisation says yes.

In fact, they discovered over 3 million people die each year from contaminated water.

And if you think you are safe because you live in the US, you'd better think again because...

Guess how many water systems contain contaminants linked to cancer?

40,000... 81%.

Guess what percentage of Americans are drinking the "Erin Brokovich" Chemical, Hexavalent Chromium?

250 million. Yes, that means, there's a 77% chance you are too.

And remember Flint, Michigan, where residents were exposed to almost 27 times the legal limit of a substance known to cause...

Brain damage, reduced intelligence, shortened attention spans and increased hyperactivity in children...

And kidney function, an increased risk of cancer, nerve pain, fatigue, high blood pressure and heart conditions in adults?

Guess what? There are over 220 Flint, Michigan's in the United States right now.

Yes, households everywhere are being unknowingly exposed to a tasteless, odorless, invisible to the human eye substance...

And it's threatening the lives of, according to the Environmental Working Group, over 200 million Americans.

Yes, I'm talking about water.

And lead is just the tip of the iceberg.

Odds are, your water supply is also being contaminated with...

Pesticides

Radium, a radioactive element, exposed to nearly 53 percent of the nation...

Uranium, a radioactive material they make bombs out of which creates a 300% greater probability of developing lung cancer, pneumonia, tuberculosis, chronic obstructive respiratory disease, and diseases of the blood.

Chromium 6, found in 75% of tap water, a highly toxic carcinogen which can wreak havoc on your liver, heart, respiratory and reproductive system - and cause cancer of the brain, kidney, breast and uterus.

Flouride - just look at the warning sign on your toothpaste label if you have any doubts...

[show warning sign]

PFAS, a class of toxic chemicals developed in the 1940's linked to kidney and testicular cancer, thyroid disease, weakened childhood immunity and other health problems, and found at 2.5x above acceptable levels in 56 percent of water utilities tested.

Medications

Parasites, bacteria and viruses linked to diarrhea, vomiting, abdominal pain and cramping, dehydration, weight loss and fevers.

There's more. Many more - including trichloromethane, benzene, atrazine, styrene, arsenic and BPA, all powerful toxins and carcinogens.

You're told to drink 8 glasses of water a day, but are you also putting yourself at risk by doing so?

The EWG compiled 28 million water records, collected from 50,000 water facilities that serve 280 million people in 50 states.

And even though all the water is legal to drink, did you know the following chemicals were found:

Lead causes PROBLEMS... and over AMOUNT American citizens are exposed to it in their water.

.

Antibiotics causes PROBLEMS... and over AMOUNT American citizens are exposed to it in their water.

Hexavalent Chromium causes PROBLEMS... and over AMOUNT American citizens are exposed to it in their water.

Teflon causes PROBLEMS... and over AMOUNT American citizens are exposed to it in their water.

LIST OTHER CHEMICALS.

This is putting your family in danger, particularly if you have kids or are thinking of having children - relate to specific chemicals.

That's the bad news.

But the good news is, you can find out exactly what those chemicals are and how to remove them from your water supply by entering your zip code into the form on this page.
